This is a Matlab/C++ code for solving PDEs that are discretized by a finite element method on unstructured grids. It uses a Domain-Specific-Language (DSL) to help streamline implementation of FE discretizations (e.g. matrix assembly) by automatic code generation. The resultant sparse matrices can be manipulated in Matlab for ease in solving a PDE on a triangular (or tetrahedral) mesh. For example, users can solve Laplace-Beltrami on a 2-D surface in 3-D. Users can do higher order geometry (e.g. quadratic triangle mappings). Users can assemble matrices (bilinear and linear forms) on embedded subdomains of co-dimension <math>\geq 0</math>.  <a href="http://www.mathworks.com/matlabcentral/fileexchange/31141-felicity/">http://www.mathworks.com/matlabcentral/fileexchange/31141-felicity/</a>  <a href="http://github.com/walkersw/felicity-finite-element-toolbox/wiki">http://github.com/walkersw/felicity-finite-element-toolbox/wiki</a> </li> <li>• <b>TIGER</b> meshing algorithm: implementation of the method in my SIAM Scientific Computing (2013) paper with a Matlab interface.
