Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### Preliminaries

Borcea studied crepant resolutions of quotients of the form

 $(E_1 \times E_2 \times E_3)/\langle \iota \times \iota \times \mathsf{id}, \iota \times \mathsf{id} \times \iota \rangle$ 

He showed the Calabi-Yau threefolds of CM-type in this family were the varieties with each of the  $E_i$  having CM.

### Calabi-Yau Threefolds

Let  $E_k/\mathbb{C}$  be an elliptic curve with an automorphism of order k = 3, 4 or 6, denoted  $\iota_k$ .

Consider the triple product  $E_k \times E_k \times E_k$  with an action by

$$G_k = \langle \iota_k \times \iota_k^{k-1} \times \mathsf{id}, \iota_k \times \mathsf{id} \times \iota_k^{k-1} \rangle.$$

For any subgroup  $H_k$  of  $G_k$  we may consider the quotient

$$(E_k \times E_k \times E_k)/H_k$$

and a crepant resolution.

#### Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### Interest

We have two main focuses with the Calabi-Yau threefolds of this form.

- (1) Study the 'easy' to understand rigid Calabi-Yau threefolds in this construction,
- (2) Push this towards the non-rigid threefolds and see how much can be extended and said.

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

#### Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

## Modularity of $X_4$

Start with k = 4 and  $G_4$ , e.g.,

- $E_4: y^2 = x^3 x$ , -  $\iota_4(x, y) = (-x, iy)$ , and -  $X_4:=\widetilde{E_4^3/G_4}$ .
- This is defined over  $\mathbb{Q}$ .
- This is a rigid threefold.  $(h^{1,1} = 90.)$
- Thus, it is modular by Gouvêa-Yui (Serre).

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

## L-function of $X_4$

Note that

1

$$\widetilde{H^3_\ell(\overline{E_4}^3/G_4)}\simeq H^3_\ell(\overline{E_4}^3/G_4),$$

and

$$H^3_\ell(\overline{E_4}^3)^{G_4} = (H^1_\ell(\overline{E_4}) \otimes H^1_\ell(\overline{E_4}) \otimes H^1_\ell(\overline{E_4}))^{G_4},$$

which is 2-dimensional.

To make things explicit, we will work with the Galois representation

$$o: G_{\mathbb{Q}} o \operatorname{Aut}_{\overline{\mathbb{Q}_{\ell}}}((V_{\ell}(E_4) \otimes V_{\ell}(E_4) \otimes V_{\ell}(E_4))^{G_4}),$$

where  $V_{\ell}(E_4) := T_{\ell}(E_4)^{\vee} \otimes \overline{\mathbb{Q}_{\ell}}$ .

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### Galois representation on $X_4$

For simplicity, denote the endomorphism  $\iota_4$  of  $E_4$  by [i] and the induced action on  $V_{\ell}(E_4)$  by  $[i]_*$ . Note that  $[i]^2 = [-1]$ .

For any 
$$\sigma \in G_{\mathbb{Q}}$$
 and  $(x, y) \in E_4(\mathbb{Q})$   

$$\sigma([i](x, y)) = (-\sigma(x), \sigma(i)\sigma(y))$$

$$= [\sigma(i)]\sigma((x, y)) = \chi(\sigma)[i]\sigma((x, y)),$$

where  $\chi : G_{\mathbb{Q}} \to \overline{\mathbb{Q}_{\ell}}^{\times}$  is the (non-trivial) Dirichlet character of  $\mathbb{Q}(i)$ . So

$$i\sigma_*(v) = \sigma_*(iv) = \sigma_*([i]_*(v)) = (\sigma \circ [i])_*(v) = ([\chi(\sigma)i] \circ \sigma])_*(v) = [\chi(\sigma)]_*([i]_*(\sigma_*))(v) = \chi(\sigma)[i]_*(\sigma_*(v)).$$

Of particular interest, if c denotes complex conjugation, then  $w = c_*(v)$  is in the (-i)-eigenspace of  $[i]_*$ .

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### Frobenius on $X_4$

For a prime  $p \neq 2$ , if  $\chi(Frob_p) = 1$  the above shows the action of  $(Frob_p)_*$  is of the form

$$\begin{pmatrix} \alpha_{p} & 0 \\ 0 & \beta_{p} \end{pmatrix}$$

and otherwise when  $\chi(\operatorname{Frob}_p) = -1$ , of the form

$$\begin{pmatrix} 0 & h_p \\ k_p & 0 \end{pmatrix}$$

Thus, on the threefold we have the respective actions

$$\begin{pmatrix} \alpha_p^3 & 0\\ 0 & \beta_p^3 \end{pmatrix}, \quad \begin{pmatrix} 0 & h_p^3\\ k_p^3 & 0 \end{pmatrix}.$$

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

## Trace of Frobenius

Thus we find

$$\operatorname{tr}(\rho(\operatorname{Frob}_{\rho})) = \alpha_{\rho}^{3} + \beta_{\rho}^{3} = (\alpha_{\rho} + \beta_{\rho})^{3} - 3\rho(\alpha_{\rho} + \beta_{\rho}).$$

Coincidentally,

#### Lemma

Let  $\psi$  be a Hecke character of an imaginary quadratic field K and suppose  $f_{\psi}$ , the cusp form associated to  $\psi$ , has trivial Nebentypus. Suppose that we have Fourier q-expansions

$$f_{\psi} = \sum a_n q^n \qquad f_{\psi^3} = \sum b_n q^n.$$

Then

$$b_p=a_p^3-3pa_p.$$

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

# L-function of $X_4$

#### Theorem

Let H be a subgroup of  $G_4$  such that  $X_4$ , a crepant resolution of  $E_4^3/H$ , is a rigid Calabi-Yau threefold. We have

$$L(X_4,s)=L(s,\chi_4^3)$$

where  $\chi_4$  is the Hecke character such that

$$L(E_4,s)=L(s,\chi_4).$$

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

#### Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### Twists

Let  $E_4(n)$  denote the twist  $y^2 = x^3 - n^2 x$ , and  $X_4(n)$  a crepant resolution of  $E_4(n)^3/G_4$ . One similarly gets

#### Theorem

Let H be a subgroup of  $G_4$  such that a crepant resolution  $X_4(n)$  of  $E_4(n)^3/H$  is a rigid Calabi-Yau threefold. We have

$$L(X_4(n),s)=L(s,\chi_4^3)$$

where  $\chi_4$  is the Hecke character such that

 $L(E_4(n),s)=L(s,\chi_4).$ 

Similar for  $E_3/E_6$  and twists.

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

## Special values

Using work of Waldspurger, one may compute the vanishing and non-varnishing of the respective L-series found above.

#### Theorem

Let  $E_4: y^2 = x^3 - x$ , and  $X_4(-n)$  a crepant resolution of  $E_4(-n)^3/G_4$ . For any odd square-free  $n \in \mathbb{N}$  we have

$$L(X_4(-n), 2) = \begin{cases} \frac{a_n^2}{\alpha \sqrt{n^3}} & \text{if } n \equiv 1 \pmod{8}, \\ \frac{b_n^2}{\beta \sqrt{n^3}} & \text{if } n \equiv 3 \pmod{8}, \\ 0 & \text{if } n \equiv 5, 7 \pmod{8}. \end{cases}$$

where  $\alpha,\beta\in\mathbb{C}^{\times}$  and

$$\sum a_n q^n = q - 3q^9 - 4q^{17} + \ldots \in S_{5/2}(128, \chi_{triv}),$$

$$\sum b_n q^n = -q^3 + 5q^{11} - 7q^{19} + \ldots \in S_{5/2}(128, \chi_{triv}).$$

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### Non-rigid construction

Suppose instead, we choose

$$H_4 = \langle \iota_4 \times \iota_4 \times \iota_4^2 \rangle \subset G_4,$$

and the quotient  $E_4^3/H_4$ .

We have  $h^{2,1} = 1$  and so  $Y_4 = \widetilde{E_4^3/H_4}$  is a *non-rigid* Calabi-Yau threefold.

What can we say now?

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds

L-functions? Families L-functions! Very non-rigid

#### Galois representation

We still need only understand the Galois representation on  $V_\ell(E_4)$ , as

 $H^3_\ell(Y_4)\simeq (V_\ell(E_4)^{\otimes 3})^{H_4}$ 

and as generators we can take

 $\begin{array}{l} x \otimes x \otimes x, x \otimes x \otimes y, \\ y \otimes y \otimes x, y \otimes y \otimes y, \end{array}$ 

where (x, y) is a basis for  $V_{\ell}(E_4)$ .

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### Action of Frobenius

For  $p \neq 2$ , and  $\chi : G_{\mathbb{Q}} \to \overline{\mathbb{Q}_{\ell}}$  as before, if  $\chi(\operatorname{Frob}_p) = 1$  the action of Frobenius is given by

$$\begin{pmatrix} \alpha_{p}^{3} & & & \\ & \alpha_{p}^{2}\beta_{p} & & \\ & & & \alpha_{p}\beta_{p}^{2} & \\ & & & & & \beta_{p}^{3} \end{pmatrix}$$

and otherwise, if  $\chi(\operatorname{Frob}_p) = -1$  the action is given by

$$\begin{pmatrix} & & h_{p}^{3} \\ & & h_{p}^{2} k_{p} \\ & & h_{p} k_{p}^{2} & & \\ k_{p}^{3} & & & \end{pmatrix}$$

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

## Trace of Frobenius

#### We have

$$\operatorname{tr}(\rho(\operatorname{Frob}_p)) = \begin{cases} \alpha_p^3 + \alpha_p^2 \beta_p + \alpha_p \beta_p^2 + \beta_p^3 & \text{if } \chi(\operatorname{Frob}_p) = 1, \\ 0 & \text{otherwise} \end{cases}$$

Note, if  $\chi(\operatorname{Frob}_p) = -1$ , then  $\alpha_p, \beta_p = \pm i \sqrt{p}$ , so

$$tr(\rho(\mathsf{Frob}_{p})) = \alpha_{p}^{3} + \alpha_{p}^{2}\beta_{p} + \alpha_{p}\beta_{p}^{2} + \beta_{p}^{3}$$
$$= \alpha_{p}^{3} + \beta_{p}^{3} + p(\alpha_{p} + \beta_{p}).$$

Hence

$$L(Y_4, s) = L(\text{Sym}^3 f_4, s) = L(\chi_4^3, s)L(\chi_4, s-1)$$

where  $\chi_4$  is the Hecke character associated to  $E_4$ .

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### Families

Consider again the triple product

$$E_4 \times E_4 \times E_4$$

with the action by  $\iota_4 \times \iota_4 \times \iota_4^2$ .

Replace this with

 $E_4 \times E_4 \times E$ 

and the action by  $\iota_4 \times \iota_4 \times \iota$ , where *E* is any non-CM elliptic curve with hyperelliptic involution  $\iota$ .

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### Galois representation

The Galois module of interest is now

$$\left(V_{\ell}(E_4)\otimes V_{\ell}(E_4)\otimes V_{\ell}(E)\right)^{\langle\iota_4\times\iota_4\times\iota\rangle},$$

so let  $V_{\ell}(E)$  have basis (u, w) and (for a good prime p) eigenvalues  $\gamma_p, \delta_p$  of Frob<sub>p</sub>.

A basis for the Galois module is then given by

 $x \otimes x \otimes u, x \otimes x \otimes w,$  $y \otimes y \otimes u, y \otimes y \otimes w.$ 

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### Trace of Frobenius

The CM-elliptic curve still gives rise to two cases. If  $\chi(Frob_p) = 1$  the action of Frobenius is given by

$$\begin{pmatrix} \alpha_p^2 \gamma_p & & & \\ & \alpha_p^2 \delta_p & & \\ & & & \beta_p^2 \gamma_p & \\ & & & & & \beta_p^2 \delta_p \end{pmatrix}$$

and otherwise, if  $\chi(Frob_p) = -1$  the action is given by

$$\begin{pmatrix} & h_p^2 \gamma_p & \\ & & h_p^2 \delta_p \\ k_p^2 \gamma_p & & \\ & & k_p^2 \delta_p & \end{pmatrix}$$

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### L-functions

#### Hence

$$\operatorname{tr}(\rho(\operatorname{Frob}_{\rho})) = \begin{cases} (\alpha_{\rho}^2 + \beta_{\rho}^2)(\gamma_{\rho} + \delta_{\rho}) & \text{if } \chi(\operatorname{Frob}_{\rho}) = 1, \\ 0 & \text{otherwise.} \end{cases}$$

Again, as  $\alpha_p, \beta_p=\pm i\sqrt{p}$  when  $\chi({\rm Frob}_p)=-1$  we may simplify to

$$\mathsf{tr}(\rho(\mathsf{Frob}_p)) = (\gamma_p + \delta_p)(\alpha_p^2 + \alpha_p\beta_p + \beta_p^2 - p\chi(\mathsf{Frob}_p)).$$

Hence, the L-function is the product

$$L(f_E \times \text{Sym}^2 f_4, s)L(f_E \otimes \chi, s-1)^{-1}.$$

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

### Automorphy

$$L(f_E \times \operatorname{Sym}^2 f_4, s) L(f_E \otimes \chi, s-1)^{-1}.$$

The following shows the L-function is automorphic:

- $\operatorname{Sym}^2 f_4$  is automorphic on GL<sub>3</sub> (Gelbart-Jaquet),
- $f_E \times \text{Sym}^2 f_4$  is automorphic on GL<sub>6</sub> (Kim-Shahidi),
- The product of automorphic L-functions is automorphic (Langlands).

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

# Construction with $E_6$

Similarly with  $E_3/E_6$ .

Except there are no non-rigid Calabi-Yau threefolds  $\boldsymbol{Y}$  of the form

$$E_6 \times E_6 \times E_6/H$$

with  $h^{2,1}(Y) = 1$  coming from the Künneth component.

What else can we do?

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### More non-rigid

Are there any subgroups of H of  $G_k$  such that

 $(E_k \times E_k \times E_k)/H$ 

only has nice singularities? Yes! For example, on

 $E_4 \times E_4 \times E_4$ , take

 $H = \langle \iota_4^2 \times \iota_4^2 \times \mathrm{id}, \iota_4^2 \times \mathrm{id} \times \iota_4^2 \rangle.$ 

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

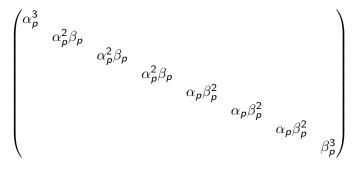

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

#### Borcea construction

Letting  $\alpha_p, \beta_p$  be the eigenvalues of  $\operatorname{Frob}_p(p \neq 2)$  on  $E_4$ , if  $\chi(\operatorname{Frob}_p) = 1$ , the action of Frobenius on  $E_4^3/H$  is given by

If  $\chi(\operatorname{Frob}_p) = -1...$ 

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

## Trace of Frobenius

Hence, we have

$$\operatorname{tr}(\rho(\operatorname{Frob}_p)) = \begin{cases} \alpha_p^3 + 3p(\alpha_p + \beta_p) + \beta_p^3 & \text{if } \chi(\operatorname{Frob}_p) = 1, \\ 0 & \text{otherwise.} \end{cases}$$

Again, the CM condition gives

$$tr(\rho(\mathsf{Frob}_p)) = \alpha_p^3 + 3p(\alpha_p + \beta_p) + \beta_p^3$$

and so the L-function is (unsurprisingly?)

$$L(\chi_4^3, s)L(\chi_4, s-1)^3.$$

This time, a similar statement holds for  $E_3/E_6$ .

Computing modularity of some Calabi-Yau threefolds

Alexander Molnar, Queen's University

Preliminaries

Rigid construction Galois representation L-functions

Non-rigid threefolds L-functions? Families L-functions! Very non-rigid

# Further questions and remarks

- Is there a relationship between the special values of E<sub>k</sub> and X<sub>k</sub>?
- What is the rank of  $CH^2(X_k)_0$ ?
- Do similar (rigid) threefolds exist for each of the weight
   4 CM newforms defined over Q?
- Can we use this approach with the Borcea-Voisin construction?
