

The second exam will be on Thursday, March 29. The syllabus will consist of Chapter NT from the text, together with the two number theory supplements passed out in class (Divisibility and Congruences). For reference, I will refer to these as Supplement D and Supplement C. You should be able to do all of the assigned problems, both suggested and those that were turned in.

Following are some of the concepts and results that were covered in class and that you should know:

- Know the definition of a divides b for integers a and b (notation: $a|b$). This is also referred to as b is *divisible* by a . (Definition 1.1, Supp. D).
- Know the *Division Algorithm*. (Theorem 1.2, Supp. D).
- Know the definition of the *greatest common divisor* of the integers a and b (notation: (a, b) or $\gcd(a, b)$).
- Know the *Euclidean Algorithm* (Theorem 1.11, Supp. D and Example 12, Section NT-2, Page 70) and how to use it to compute the greatest common divisor of integers a and b .
- Know how to use the Euclidean algorithm to write the greatest common divisor g of two integers a and b in the form $g = ax + by$, for some integers x and y . (See Page 8, Supp. D.)
- Know the definition of *relatively prime integers*.
- Be sure to know Theorem 1.10 (Page 7, Supp. D) which relates the relative primeness of two integers to a divisibility conclusion: *If $c|ab$ and $\gcd(b, c) = 1$, then $c|a$.*
- Know the definition of *least common multiple* of integers a and b (notation: $[a, b]$ or $\text{lcm}(a, b)$).
- Know the relationship between the greatest common divisor, least common multiple, and the product of integers a and b : $ab = (a, b)[a, b]$.
- Know the definition of *prime* number.
- Know the definition of *composite* number.
- Know Euclid's Lemma (Theorem 1.15 Page 14, Supp. D): If p is a prime, a and b are integers, and $p|ab$, then $p|a$ or $p|b$.
- Know the Fundamental Theorem of Arithmetic (Theorem 1.16, Page 14, Supp. D, and Theorem 1, Page 55 of Section NT-1.), and how to use it to compute the greatest common divisor and least common multiple of two integers a and b (Theorem 6, Page 69, Section NT-2, and Pages 15-16 of Supp. D).
- Know Euclid's argument to show that there are infinitely many prime integers. (Theorem 1.17, Page 16 of Supp. D, and Theorem 2, Page 56 of Section NT-1.)
- Know what it means for an integer a to be *congruent modulo n* to another integer b (notation $a \equiv b \pmod{n}$).
- Know the definition of *congruence class or residue class of a modulo n* (notation $[a]_n = n\mathbb{Z} + j = \{nk + j : k \in \mathbb{Z} \text{ and } j \text{ is the remainder when } a \text{ is divided by } n\}$). Sup. C, Page 53 or Section NT-1, Page 58.

- Know the number system \mathbb{Z}_n of congruence classes modulo n , and how to do arithmetic in \mathbb{Z}_n :

$$\begin{aligned}[a]_n + [b]_n &= [a + b]_n \\ [a]_n [b]_n &= [ab]_n\end{aligned}$$

See Supp. C, Page 53 or Theorem 4, Section NT-1, Page 59.

- Know what it means to solve a *linear congruence*

$$ax \equiv b \pmod{n}.$$

In particular, know that the solutions form congruence classes modulo n , so that they can be identified with elements of \mathbb{Z}_n . See Theorem 8.1, Supp. C.

- Know the criterion for solvability of a linear congruence, namely Theorem 8.1, Supp. C, and know how to find all of the solutions to a linear congruence using the algorithm on Page 56 Supp. C, based on the Euclidean algorithm to find the greatest common divisor of a and n .
- The congruence class $[a]_n$ is *invertible* in \mathbb{Z}_n , or a is invertible modulo n if the congruence equation $ax \equiv 1 \pmod{n}$ is solvable. A solution of this congruence is denoted $x = [a]_n^{-1}$
- Know the criterion of invertibility of $[a]_n$: An element $[a]_n \in \mathbb{Z}_n$ is invertible (or a has a multiplicative inverse modulo n) if and only if $(a, n) = 1$, that is, if and only if a and n are relatively prime. Moreover, if r and s are integers such that $ar + ns = 1$, then $[a]_n^{-1} = [r]_n$. See the note following Theorem 8.1, Supp. C.
- Know how to use the Euclidean algorithm to compute $[a]_n^{-1}$, when the inverse exists.
- Know Fermat's theorem: if p is prime and p does not divide a then $a^{p-1} \equiv 1 \pmod{p}$. (Theorem 9.1, Page 61 of Supp. C).
- The Euler phi-function is defined by

$$\varphi(n) = \# \{a : 1 \leq a \leq n \text{ and } \gcd(a, n) = 1\},$$

where $\#S$ denotes the number of elements in the set S . Thus $\varphi(n)$ is the *number of integers between 1 and n that are relatively prime to n* .

- Know how to use Theorem 11.1 (Supp. C, Page 72) to compute $\varphi(n)$ from the prime factorization of n : If $n = p_1^{k_1} \cdots p_r^{k_r}$, then

$$\varphi(n) = (p_1^{k_1} - p_1^{k_1-1}) \cdots (p_r^{k_r} - p_r^{k_r-1}) = n \left(1 - \frac{1}{p_1}\right) \cdots \left(1 - \frac{1}{p_r}\right).$$

- Know Euler's Theorem: If $n \geq 2$ and a is relatively prime to n , then

$$a^{\varphi(n)} \equiv 1 \pmod{n}.$$

- Know how to use Euler's Theorem to compute powers a^k modulo n , as we did in class and on Exercise Set 5.

- Know the Chinese Remainder Theorem (Theorem 11.2, Page 74 of Supp. C), and how to solve simultaneous congruences.

Review Exercises

Be sure that you know how to do all assigned homework exercises. The following are supplementary exercises, in many but not all cases, similar to those already assigned as homework. These exercises are listed randomly. That is, there is no attempt to give the exercises in the order of presentation of material in the text.

1. The following are **True/False** questions. Decide if each statement is True or False. You should be able to explain your reasoning.

(a) If a , b , and c are nonzero integers such that $c|a$ and $c|b$, then $\gcd(a, b) \leq c$.

► **Solution. False.** Counterexample: $a = 2$, $b = 4$, $c = 1$. ◀

(b) $\gcd(a, 1) = 1$ for any integer a .

► **Solution. True.** ◀

(c) The integers 77 and 105 are relatively prime.

► **Solution. False.** $\gcd(77, 105) = 7 \neq 1$. ◀

(d) If a , b , and c are integers such that $a|bc$, then $a|b$ or $a|c$.

► **Solution. False.** Counterexample: $a = 6$, $b = 2$, $c = 3$. ◀

(e) If a , b , and c are integers such that $a|b$ and $c|b$, then $ac|b$.

► **Solution. False.** Counterexample: $a = b = c = 2$. The conclusion is true if the additional assumption $\gcd(a, c) = 1$ is satisfied. ◀

(f) If $\gcd(a, b) = \text{lcm}(a, b)$, then $a = b$.

► **Solution. False.** Counterexample: $a = -b$. ◀

(g) If $a|c$ and $b|c$, then $\text{lcm}(a, b) \leq c$.

► **Solution. True.** This is Theorem 1.12, Page 9 on the Divisibility Supplement. ◀

(h) If a and b are relatively prime natural numbers, then $\text{lcm}(a, b) = ab$.

► **Solution. True.** This follows from Theorem 1.13, Page 9 on the Divisibility Supplement. ◀

(i) If $(a, b) = 1$ and $(c, d) = 1$, then $(ac, bd) = 1$.

► **Solution. False.** Counterexample: $a = d = 2$, $b = c = 3$. ◀

(j) If there exist integers r and s such that $ra + sb = d$, then $d = (a, b)$.

► **Solution. False.** Counterexample, $a = 3, b = 2, r = d = 5, s = -5$. ◀

- (k) Every natural number $n \geq 2$ can be written $n = p_1 p_2 \cdots p_r$ as the product of distinct prime numbers p_1, p_2, \dots, p_r .

► **Solution. False.** Counterexample: $n = 4$. In this case the prime 2 must be used twice in the prime factorization. ◀

- (l) For all $n \in \mathbb{N}$, $n > 1$, there exists a prime p such that $p|n$.

► **Solution. True.** This just says that every natural number greater than 1 is divisible by *some* prime. This follows from Theorem 1.14 Page 11 of the Divisibility Supplement. ◀

- (m) There exists a prime p such that $p|n$ for all $n \in \mathbb{N}$, $n > 1$.

(The position of the universal quantifier makes a lot of difference!)

► **Solution. False.** There is no prime that divides *every* natural number $n > 1$. Counterexample: There is no prime that divides both 2 and 3. ◀

- (n) $5x \equiv 3 \pmod{10}$ has no solution.

► **Solution. True.** This is because $\gcd(5, 10) = 5$ does not divide 3. ◀

- (o) $49x \equiv 1 \pmod{81}$ has no solution.

► **Solution. False.** This equation is solvable since $\gcd(49, 81) = 1$. ◀

- (p) $84^{10} \equiv 1 \pmod{11}$.

► **Solution. True.** This follows from Fermat's Theorem, since 11 is prime and $11 \nmid 84$. ◀

2. Find the remainder when b is divided by a if:

- (a) $a = 6, b = 25$

► **Solution.** $25 = 6 \cdot 4 + 1$, so the remainder is 1. ◀

- (b) $a = -6, b = -25$

► **Solution.** $-25 = (-6) \cdot 5 + 4$, so the remainder is 4. ◀

3. This problem involves arithmetic modulo 16. All answers should only involve expressions of the form $[a]_{16}$, with a an integer and $0 \leq a < 16$.

- (a) Compute $[4]_{16} + [15]_{16}$.

► **Solution.** $[4]_{16} + [15]_{16} = [4]_{16} + [-1]_{16} = [3]_{16}$. ◀

- (b) Compute $[4]_{16}[15]_{16}$.

► **Solution.** $[4]_{16}[15]_{16} = [4]_{16}[-1]_{16} = [-4]_{16} = [12]_{16}$. ◀

(c) Compute $[15]_{16}^{-1}$.

► **Solution.** $[15]_{16}^{-1} = [-1]_{16}^{-1} = [-1]_{16} = [15]_{16}$. ◀

(d) List the invertible elements of \mathbb{Z}_{16} .

► **Solution.** $[1]_{16}, [3]_{16}, [5]_{16}, [7]_{16}, [9]_{16}, [11]_{16}, [13]_{16}, [15]_{16}$. ◀

4. Express 24 and 102 as products of primes and use this information to calculate $(12, 102)$ and $[12, 102]$.

► **Solution.** $24 = 8 \cdot 3 = 2^3 \cdot 3$ and $102 = 2 \cdot 3 \cdot 17$. Then $(12, 102) = 2 \cdot 3 = 6$ and $[12, 102] = 2^2 \cdot 3 \cdot 17 = 204$. ◀

5. Find the prime factorization of each of the following natural numbers.

(a) 856

(b) 2323

(c) 6647

(d) $(2^8 - 1)^{20}$

► **Solution.** (a) $856 = 2^3 \cdot 107$ (b) $2320 = 2^3 \cdot 101$ (c) $6647 = 17^2 \cdot 23$ (d) $(2^8 - 1)^{20} = 255^{20} = 3^{20} \cdot 5^{20} \cdot 17^{20}$ ◀

6. Determine all $x \in \mathbb{Z}$ that solve the linear congruence

$$6x \equiv 9 \pmod{15}.$$

► **Solution.** Use the algorithm from Theorem 8.1 (Page 57) of the Congruence Supplement. First, $g = \gcd(6, 15) = 3$ and by inspection (or using the Euclidean Algorithm) write $6(-2) + 15 = 3$ and multiplying this equation by $9/g = 3$ gives $6(-6) \equiv 9 \pmod{15}$. Thus, $x_0 = -6$ is one solution, and a complete set of incongruent solutions is given by

$$x = x_0 + k \cdot \frac{15}{g} \pmod{15}, \quad \text{for } k = 0, 1, 2.$$

That is, $x \equiv -6, -1, \text{ or } 4 \pmod{15}$. If you prefer a set of incongruent solutions consisting only of positive integers, then $x \equiv 4, 9, 14 \pmod{15}$ are the three smallest positive solutions. ◀

7. (a) Find the greatest common divisor $d = (803, 154)$ of 803 and 154, using the Euclidean Algorithm.

► **Solution.** Repeated divisions give

$$803 = 5 \cdot 154 + 33$$

$$154 = 4 \cdot 33 + 22$$

$$33 = 1 \cdot 22 + 11$$

$$22 = 2 \cdot 11 + 0.$$

Hence $\gcd(803, 154) = 11$. ◀

(b) Write $d = (803, 154)$ in the form $d = s \cdot 803 + t \cdot 154$.

► **Solution.** Reverse the steps used to find the $\gcd(803, 154)$:

$$\begin{aligned} 11 &= 33 - 22 \\ &= 33 - (154 - 4 \cdot 33) \\ &= 5 \cdot 33 - 154 \\ &= 5(803 - 5 \cdot 154) - 154 \\ &= 5 \cdot 803 - 26 \cdot 154. \end{aligned}$$

Thus, $\gcd(803, 154) = 11 = 5 \cdot 803 - 26 \cdot 154$. ◀

(c) Find the least common multiple $[803, 154]$.

► **Solution.** Use Theorem 1.13 Page 9 of the Divisibility Supplement. Namely, $(a, b)[a, b] = ab$ if a and b are nonzero positive integers.

$$[803, 154] = \frac{803 \cdot 154}{(803, 154)} = \frac{123662}{11} = 11242.$$

◀

8. Compute $3^{80} \pmod{7}$.

► **Solution.** Since 7 is prime, Fermat's Theorem gives that $3^6 \equiv 1 \pmod{7}$. Dividing the exponent 80 by 6 gives $80 = 13 \cdot 6 + 2$ so

$$3^{80} = 3^{13 \cdot 6 + 2} = (3^6)^{13} 3^2 \equiv 3^2 \equiv 9 \equiv 2 \pmod{7}.$$

◀

9. Find all integers such that $5x \equiv 1 \pmod{100}$. Briefly explain your answer.

► **Solution.** Since $\gcd(5, 100) = 5$ and $5 \nmid 1$, there are not solutions to this congruence. ◀

10. Solve the system of congruences:

$$\begin{aligned} x &\equiv 5 \pmod{25} \\ x &\equiv 23 \pmod{32}. \end{aligned}$$

► **Solution.** Use the Euclidean algorithm to write $9 \cdot 25 - 7 \cdot 32 = 1$. Then $x = 9 \cdot 25 \cdot 23 - 7 \cdot 32 \cdot 5 = 4055$ modulo $25 \cdot 32 = 800$. Reducing modulo 800 gives $x = 55$ modulo 800. Thus all solutions of the simultaneous congruences are $x = 55 + 800k$ for $k \in \mathbb{Z}$. ◀

11. Find the smallest positive integer that gives a remainder of 5 when divided by 341 and a remainder of 11 when divided by 189.

► **Solution.** The given conditions mean that x must be a solution of the simultaneous congruences

$$\begin{aligned}x &\equiv 5 \pmod{341} \\x &\equiv 11 \pmod{189}.\end{aligned}$$

Use the Euclidean algorithm to write $83 \cdot 189 - 46 \cdot 341 = 1$. In particular, this shows that $\gcd(341, 189) = 1$ so the Chinese Remainder Theorem applies. Thus,

$$x = 5 \cdot 83 \cdot 189 - 11 \cdot 46 \cdot 341 = -94111 \pmod{(189 \cdot 341 = 64449)}.$$

To get the smallest positive solution, simply add a multiple of 64449. Thus, the smallest positive solution is

$$-94111 + 2 \cdot 64449 = 34787.$$

As a check, note that

$$\begin{aligned}34787 &= 102 \cdot 341 + 5 \\34787 &= 184 \cdot 189 + 11,\end{aligned}$$

so that $34787 \equiv 5 \pmod{341}$ and $34787 \equiv 11 \pmod{189}$. ◀

12. Give an example of integers a, b, m, n such that the system of congruences

$$\begin{aligned}x &\equiv a \pmod{m} \\x &\equiv b \pmod{n}\end{aligned}$$

has no solution.

► **Solution.** One example is

$$\begin{aligned}x &\equiv 1 \pmod{2} \\x &\equiv 0 \pmod{2}\end{aligned}$$

◀
