Instructions. Answer each of the questions on your own paper. Put your name on each page of your paper. Be sure to show your work so that partial credit can be adequately assessed. *Credit will not be given for answers (even correct ones) without supporting work.* A table of Laplace transforms, a table of convolution products, and the statement of the main partial fraction decomposition theorem have been appended to the exam.

1. [**14 Points**]

   (a) Complete the following definition: Suppose $f(t)$ is a continuous function defined for all $t \geq 0$. The **Laplace transform** of f is the function $F(s)$ defined as follows:

   $$F(s) = \mathcal{L}\{f(t)\}(s) = \boxed{}$$

   for all s sufficiently large.

   (b) Using your definition compute the Laplace transform of $f(t) = 3e^{-5t} + 2$.

2. [**21 Points**] Compute the Laplace transform of each of the following functions. You may use the attached tables, but be sure to identify which formulas you are using by citing the number(s) in the table.

   (a) $f_1(t) = e^{-2t}(3t^4 + 5\cos 3t)$

   (b) $f_2(t) = t \sin 2t$

   (c) $f_3(t) = t^3 * \sin 2t$ (Recall that $f * g$ is the *convolution* product of f and g.

3. [**21 Points**] Compute the inverse Laplace transform of each of the following rational functions.

   (a) $F(s) = \dfrac{2s^2 - 3s + 1}{s^3}$

   (b) $G(s) = \dfrac{s^2 + 4}{(s+1)(s+2)(s-2)}$

   (c) $H(s) = \dfrac{2s + 5}{s^2 + 4s + 13}$

4. [**24 Points**] Find the *characteristic polynomial* and the general solution of each of the following constant coefficient linear homogeneous differential equations:

   (a) $y'' - 4y' + 9y = 0$

   (b) $y'' - 6y' + 9y = 0$

   (c) $y'' - 10y' + 9y = 0$

   (d) $y''' + 9y' = 0$

5. [**20 Points**] Use the Laplace transform method to find the solution of the following initial value problem:

   $$y'' + 4y' + 4y = te^{-2t}, \qquad y(0) = 1,\ y'(0) = -2.$$

Partial Fraction Expansion Theorems

The following two theorems are the main partial fractions expansion theorems, as presented in the text.

Theorem 1 (Linear Case). *Suppose a proper rational function can be written in the form*

$$\frac{p_0(s)}{(s-\lambda)^n q(s)}$$

and $q(\lambda) \neq 0$. *Then there is a unique number* A_1 *and a unique polynomial* $p_1(s)$ *such that*

$$\frac{p_0(s)}{(s-\lambda)^n q(s)} = \frac{A_1}{(s-\lambda)^n} + \frac{p_1(s)}{(s-\lambda)^{n-1} q(s)}. \tag{1}$$

The number A_1 *and the polynomial* $p_1(s)$ *are given by*

$$A_1 = \left.\frac{p_0(s)}{q(s)}\right|_{s=\lambda} \qquad \text{and} \qquad p_1(s) = \frac{p_0(s) - A_1 q(s)}{s-\lambda}. \tag{2}$$

Theorem 2 (Irreducible Quadratic Case). *Suppose a real proper rational function can be written in the form*

$$\frac{p_0(s)}{(s^2+cs+d)^n q(s)},$$

where s^2+cs+d *is an irreducible quadratic that is factored completely out of* $q(s)$. *Then there is a unique linear term* $B_1 s + C_1$ *and a unique polynomial* $p_1(s)$ *such that*

$$\frac{p_0(s)}{(s^2+cs+d)^n q(s)} = \frac{B_1 s + C_1}{(s^2+cs+d)^n} + \frac{p_1(s)}{(s^s+cs+d)^{n-1} q(s)}. \tag{3}$$

If $a+ib$ *is a complex root of* s^2+cs+d *then* $B_1 s + C_1$ *and the polynomial* $p_1(s)$ *are given by*

$$B_1 s + C_1\big|_{s=a+bi} = \left.\frac{p_0(s)}{q(s)}\right|_{s=a+bi} \qquad \text{and} \qquad p_1(s) = \frac{p_0(s) - (B_1 s + C_1) q(s)}{s^2+cs+d}. \tag{4}$$
