Control System: $\dot{q} = f(q, u, d)$, $y = H(q)$

$q = \text{state variable}$

$y = \text{output}$

$u = \text{controller depending on } y$

$d = \text{unknown disturbance function}$
Control System: \( \dot{q} = f(q, u, d), \ y = H(q) \)

- \( q \) = state variable
- \( y \) = output
- \( u \) = controller depending on \( y \)
- \( d \) = unknown disturbance function

Trajectories for initial state \( q_0 \) are denoted \( q(t) = \phi(t, q_0, d) \).
Control System: \( \dot{q} = f(q, u, d), \ y = H(q) \)

- \( q \) = state variable
- \( y \) = output
- \( u \) = controller depending on \( y \)
- \( d \) = unknown disturbance function

Trajectories for initial state \( q_0 \) are denoted \( q(t) = \phi(t, q_0, d) \).

**Goal of Control Theory:** Find an explicit \( u(y) \) so that all trajectories \( q(t) \) meet some prescribed control objective.
Control System: \( \dot{q} = f(q, u, d) \), \( y = H(q) \)

- \( q \) = state variable
- \( y \) = output
- \( u \) = controller depending on \( y \)
- \( d \) = unknown disturbance function

Trajectories for initial state \( q_0 \) are denoted \( q(t) = \phi(t, q_0, d) \).

**Goal of Control Theory:** Find an explicit \( u(y) \) so that all trajectories \( q(t) \) meet some prescribed control objective.

**Main Method:** Design \( u(y) \) in conjunction with an explicit construction of a Lyapunov function for the control system.
Control System: \[ \dot{q} = f(q, u, d), \quad y = H(q) \]

- \( q \) = state variable
- \( y \) = output
- \( u \) = controller depending on \( y \)
- \( d \) = unknown disturbance function

Trajectories for initial state \( q_0 \) are denoted \( q(t) = \phi(t, q_0, d) \).

**Goal of Control Theory:** Find an explicit \( u(y) \) so that all trajectories \( q(t) \) meet some prescribed control objective.

**Main Method:** Design \( u(y) \) in conjunction with an explicit construction of a Lyapunov function for the control system.

**Significance:** Explicit Lyapunov functions allow us to precisely quantify the effect of the uncertainty \( d(t) \).
Control System: $\dot{q} = f(q, u, d)$, $y = H(q)$

$q = \text{state variable}$

$y = \text{output}$

$u = \text{controller depending on } y$

$d = \text{unknown disturbance function}$
Control System: \( \dot{q} = f(q, u, d) \), \( y = H(q) \)

- \( q \) = state variable
- \( y \) = output
- \( u \) = controller depending on \( y \)
- \( d \) = unknown disturbance function

ISS [Sontag, 1989]: \( \exists \) functions \( \beta \in \mathcal{KL}, \gamma \in \mathcal{K}_{\infty} \) such that
\[
|q(t)| \leq \beta(|q(0)|, t) + \gamma(|d|_{\infty})
\]
along all trajectories.
Control System: $\dot{q} = f(q, u, d)$, $y = H(q)$

$q =$ state variable
$y =$ output
$u =$ controller depending on $y$
$d =$ unknown disturbance function

ISS [Sontag, 1989]: $\exists$ functions $\beta \in \mathcal{KL}$, $\gamma \in \mathcal{K}_\infty$ such that $|q(t)| \leq \beta(|q(0)|, t) + \gamma(|d|_\infty)$ along all trajectories.

$\mathcal{KL}$: Means (0) $\beta$ continuous, (1) $\beta(\cdot, t) \in \mathcal{K}_\infty \forall t \geq 0$ and (2) $\forall r \geq 0$, $\beta(r, \cdot)$ is non-increasing and $\beta(r, t) \to 0$ as $t \to +\infty$.

$\mathcal{K}_\infty$: Means unbounded strictly increasing modulus.
Control System: $\dot{q} = f(q, u, d)$, $y = H(q)$

$q = \text{state variable}$

$y = \text{output}$

$u = \text{controller depending on } y$

$d = \text{unknown disturbance function}$

ISS [Sontag, 1989]: $\exists$ functions $\beta \in \mathcal{KL}$, $\gamma \in \mathcal{K}_\infty$ such that

$|q(t)| \leq \beta(|q(0)|, t) + \gamma(|d|_\infty)$

along all trajectories.

ISS Lyapunov Function: A $C^1$ proper positive definite function $V$ for which there exist $\alpha_1, \alpha_2 \in \mathcal{K}_\infty$ such that

$\nabla V(q) f(q, u(q), d) \leq -\alpha_1(|q|) + \alpha_2(|d|)$

everywhere.
Control System: $\dot{q} = f(q, u, d), y = H(q)$

$q =$ state variable
$y =$ output
$u =$ controller depending on $y$
$d =$ unknown disturbance function

ISS [Sontag, 1989]: $\exists$ functions $\beta \in \mathcal{KL}, \gamma \in \mathcal{K}_\infty$ such that $|q(t)| \leq \beta(|q(0)|, t) + \gamma(|d|_\infty)$ along all trajectories.

ISS Lyapunov Function: A $C^1$ proper positive definite function $V$ for which there exist $\alpha_1, \alpha_2 \in \mathcal{K}_\infty$ such that $\nabla V(q)f(q, u(q), d) \leq -\alpha_1(|q|) + \alpha_2(|d|)$ everywhere.

Lyapunov Characterizations [Sontag-Wang, 1995]: The system is ISS iff it admits an ISS Lyapunov function.

CHEMOSTAT SET-UP

Feed Vessel → Culture Vessel → Collecting Receptacle
**MODEL and GOAL**

**Basic Model:** The two-species chemostat with nutrient concentration \( S(t) \) and organism concentrations \( X_i(t) \) evolving on \( \mathcal{X} := (0, \infty)^3 \) is

\[
\begin{aligned}
\dot{S} &= D[S_0 - S] - \frac{\mu_1(S)}{Y_1} X_1 - \frac{\mu_2(S)}{Y_2} X_2, \\
\dot{X}_i &= [\mu_i(S) - D] X_i, \quad i = 1, 2
\end{aligned}
\]
Basic Model: The two-species chemostat with nutrient concentration $S(t)$ and organism concentrations $X_i(t)$ evolving on $\mathcal{X} := (0, \infty)^3$ is
\[
\begin{align*}
\dot{S} & = D[S_0 - S] - \frac{\mu_1(S)}{Y_1} X_1 - \frac{\mu_2(S)}{Y_2} X_2 , \\
\dot{X}_i & = [\mu_i(S) - D] X_i , \quad i = 1, 2
\end{align*}
\]

$D(\cdot) =$ dilution rate. $S_0(\cdot) =$ input nutrient concentration. $Y_i =$ yield. $\mu_i(S) = \frac{K_i S}{L_i + S} =$ (Monod) uptake function, with $K_i, L_i > 0$ constants.
Basic Model: The two-species chemostat with nutrient concentration $S(t)$ and organism concentrations $X_i(t)$ evolving on $\mathcal{X} := (0, \infty)^3$ is

$$\begin{align*}
\dot{S} &= D[S_0 - S] - \frac{\mu_1(S)}{\mathcal{Y}_1} X_1 - \frac{\mu_2(S)}{\mathcal{Y}_2} X_2, \\
\dot{X}_i &= [\mu_i(S) - D]X_i, \quad i = 1, 2
\end{align*}$$

$D(\cdot) =$ dilution rate. $S_0(\cdot) =$ input nutrient concentration. $\mathcal{Y}_i =$ yield. $\mu_i(S) = \frac{K_iS}{L_i + S} =$ (Monod) uptake function, with $K_i, L_i > 0$ constants.

Goal: Given any $X_{i*} > 0$, design $S_0$ and $D(\cdot)$, depending only on $Y = X_1 + AX_2$ (where $A$ is a given positive constant), that render $(S_*, X_{1*}, X_{2*}) \in \mathcal{X}$ robustly GAS.
Basic Model: The two-species chemostat with nutrient concentration $S(t)$ and organism concentrations $X_i(t)$ evolving on $\mathcal{X} := (0, \infty)^3$ is

$$
\begin{align*}
\dot{S} &= D[S_0 - S] - \frac{\mu_1(S)}{\gamma_1} X_1 - \frac{\mu_2(S)}{\gamma_2} X_2, \\
\dot{X}_i &= [\mu_i(S) - D] X_i, \quad i = 1, 2
\end{align*}
$$

$D(\cdot) = \text{dilution rate. } S_0(\cdot) = \text{input nutrient concentration.}$$

$\gamma_i = \text{yield. } \mu_i(S) = \frac{K_i S}{L_i + S} = (\text{Monod}) \text{ uptake function, with } K_i, L_i > 0 \text{ constants.}$

Competitive Exclusion: When $S_0(\cdot)$ and $D$ are constant and the $\mu_i$’s are increasing, at most one species survives.
Coexistence: In real ecological systems, $n > 1$ species can coexist on 1 substrate, so much of the literature aims at choosing $S_0$ and/or $D$ to force coexistence.
OVERVIEW of LITERATURE

Coexistence: In real ecological systems, \( n > 1 \) species can coexist on 1 substrate, so much of the literature aims at choosing \( S_0 \) and/or \( D \) to force coexistence.

Time-Varying Controls: Have competitive exclusion if \( n = 2 \) and one of the controls is fixed and the other is periodic. See Hal Smith (SIAP’81), Hale-Somolinos (JMB’83),..
OVERVIEW of LITERATURE

Coexistence: In real ecological systems, $n > 1$ species can coexist on 1 substrate, so much of the literature aims at choosing $S_0$ and/or $D$ to force coexistence.

Time-Varying Controls: Have competitive exclusion if $n = 2$ and one of the controls is fixed and the other is periodic. See Hal Smith (SIAP’81), Hale-Somolinos (JMB’83),..*

Feedback Controls: De Leenheer-Smith (JMB’03) generated a coexistence equilibrium for $n = 2, 3$. See Mazenc-M-Harmand (ACC’07, TCAS’08) for $n = 2$ with explicit Lyapunov functions and tracking of oscillations.

STANDING ASSUMPTION

\exists S_* > 0 \text{ such that (i) } \mu_1(S_*) = \mu_2(S_*), \text{ (ii) } \mu_2(S) < \mu_1(S') \text{ if } 0 < S < S_*, \text{ and (iii) } \mu_2(S) > \mu_1(S) \text{ if } S > S_*.
STANDING ASSUMPTION

\[ \exists S_* > 0 \text{ such that (i) } \mu_1(S_*) = \mu_2(S_*), \text{ (ii) } \mu_2(S) < \mu_1(S') \text{ if } 0 < S < S_*, \text{ and (iii) } \mu_2(S) > \mu_1(S) \text{ if } S > S_* . \]

Example: Take \( \mu_1(S') = \frac{0.5S}{0.05+S} \) and \( \mu_2(S') = \frac{S}{1+S} \).
\[ \exists S_\ast > 0 \text{ such that (i) } \mu_1(S_\ast) = \mu_2(S_\ast), \text{ (ii) } \mu_2(S) < \mu_1(S) \text{ if } 0 < S < S_\ast, \text{ and (iii) } \mu_2(S) > \mu_1(S) \text{ if } S > S_\ast. \]

**Example:** Take \[ \mu_1(S') = \frac{0.5S}{0.05+S} \] and \[ \mu_2(S') = \frac{S}{1+S}. \] \[ S_\ast = 0.9. \]
\exists S_* > 0 \text{ such that } (i) \mu_1(S_*) = \mu_2(S_*), \text{ (ii) } \mu_2(S) < \mu_1(S) \text{ if } 0 < S < S_*, \text{ and (iii) } \mu_2(S) > \mu_1(S) \text{ if } S > S_*.

Example: Take \( \mu_1(S) = \frac{0.5S}{0.05+S} \) and \( \mu_2(S) = \frac{S}{1+S} \). \( S_* = 0.9 \).
OUR MAIN STABILITY THEOREM

Set $\sigma(r) = \frac{r}{\sqrt{1+r^2}}$, $x_i = X_i/Y_i$, $y = x_1 + ax_2$, $a = AY_2/Y_1$. 
Set \( \sigma(r) = \frac{r}{\sqrt{1+r^2}} \), \( x_i = X_i/Y_i \), \( y = x_1 + ax_2 \), \( a = AY_2/Y_1 \).

Fix any \( x_{i*} > 0 \). Errors: \( \xi_i = \ln(x_i/x_{i*}) \) and \( \Sigma = \ln(S/S_*) \).
OUR MAIN STABILITY THEOREM

Set $\sigma(r) = \frac{r}{\sqrt{1+r^2}}$, $x_i = X_i/Y_i$, $y = x_1 + ax_2$, $a = A\gamma_2/\gamma_1$. Fix any $x_{i*} > 0$. Errors: $\xi_i = \ln(x_i/x_{i*})$ and $\Sigma = \ln(S/S_*)$.

Theorem 1: Assume $\varepsilon \in (0, \bar{\varepsilon}]$ and $a \neq 1$. Then $(S_*, x_{1*}, x_{2*})$ is a GAS equilibrium for the $(S, x_1, x_2)$ dynamics when

$$S_0 = S_* + x_{1*} + x_{2*}$$

$$D(y) = \mu_1(S_*) - \varepsilon(a - 1)\sigma(y - x_{1*} - ax_{2*})$$.
Set $\sigma(r) = \frac{r}{\sqrt{1 + r^2}}$, $x_i = X_i/Y_i$, $y = x_1 + ax_2$, $a = AY_2/Y_1$.

Fix any $x_{i*} > 0$. Errors: $\xi_i = \ln(x_i/x_{i*})$ and $\Sigma = \ln(S/S_*)$.

**Theorem 1:** Assume $\varepsilon \in (0, \bar{\varepsilon}]$ and $a \neq 1$. Then $(S_*, x_{1*}, x_{2*})$ is a GAS equilibrium for the $(S, x_1, x_2)$ dynamics when

$$
S_0 = S_* + x_{1*} + x_{2*}
$$

$$
D(y) = \mu_1(S_*) - \varepsilon(a - 1)\sigma(y - x_{1*} - ax_{2*}).
$$

More precisely, we can construct a function $\beta \in KL$ such that $|(\Sigma, \xi_1, \xi_2)(t)| \leq \beta(||(\Sigma, \xi_1, \xi_2)(0)||, t)$ for all $t \geq 0$ along all trajectories $(S, x_1, x_2)(t)$ of the closed loop dynamics.
OUR MAIN STABILITY THEOREM

Set \( \sigma(r) = \frac{r}{\sqrt{1+r^2}} \), \( x_i = X_i/Y_i \), \( y = x_1 + ax_2 \), \( a = AY_2/Y_1 \).

Fix any \( x_{i*} > 0 \). Errors: \( \xi_i = \ln(x_i/x_{i*}) \) and \( \Sigma = \ln(S/S_*) \).

Theorem 1: Assume \( \varepsilon \in (0, \bar{\varepsilon}] \) and \( a \neq 1 \). Then \( (S_*, x_{1*}, x_{2*}) \) is a GAS equilibrium for the \( (S, x_1, x_2) \) dynamics when

\[
S_0 = S_* + x_{1*} + x_{2*}
\]

\[
D(y) = \mu_1(S_*) - \varepsilon(a - 1)\sigma(y - x_{1*} - ax_{2*})
\]

More precisely, we can construct a function \( \beta \in \mathcal{KL} \) such that \( |(\Sigma, \xi_1, \xi_2)(t)| \leq \beta(|(\Sigma, \xi_1, \xi_2)(0)|, t) \) for all \( t \geq 0 \) along all trajectories \( (S, x_1, x_2)(t) \) of the closed loop dynamics.

See full paper for the explicit construction of \( \bar{\varepsilon} > 0 \) and \( \beta \).
OUR MAIN STABILITY THEOREM

Set $\sigma(r) = \frac{r}{\sqrt{1+r^2}}$, $x_i = X_i/\mathcal{V}_i$, $y = x_1 + ax_2$, $a = A\mathcal{V}_2/\mathcal{V}_1$. Fix any $x_{i*} > 0$. Errors: $\xi_i = \ln(x_i/x_{i*})$ and $\Sigma = \ln(S/S_*)$.

Theorem 1: Assume $\varepsilon \in (0, \bar{\varepsilon}]$ and $a \neq 1$. Then $(S_*, x_{1*}, x_{2*})$ is a GAS equilibrium for the $(S, x_1, x_2)$ dynamics when

\[
S_0 = S_* + x_{1*} + x_{2*}
\]

\[
D(y) = \mu_1(S_*) - \varepsilon(a - 1)\sigma(y - x_{1*} - ax_{2*}).
\]

More precisely, we can construct a function $\beta \in \mathcal{KL}$ such that $|(\Sigma, \xi_1, \xi_2)(t)| \leq \beta(||(\Sigma, \xi_1, \xi_2)(0)||, t)$ for all $t \geq 0$ along all trajectories $(S, x_1, x_2)(t)$ of the closed loop dynamics.

Remark: Cannot pick $\varepsilon = 0$. 
Set $\sigma(r) = \frac{r}{\sqrt{1+r^2}}$, $x_i = X_i/\mathcal{Y}_i$, $y = x_1 + ax_2$, $a = A\mathcal{Y}_2/\mathcal{Y}_1$.

Fix any $x_{i*} > 0$. Errors: $\xi_i = \ln(x_i/x_{i*})$ and $\Sigma = \ln(S/S_*)$.

**Theorem 1:** Assume $\varepsilon \in (0, \bar{\varepsilon}]$ and $a \neq 1$. Then $(S_*, x_{1*}, x_{2*})$ is a GAS equilibrium for the $(S, x_1, x_2)$ dynamics when

$$S_0 = S_* + x_{1*} + x_{2*}$$

$$D(y) = \mu_1(S_*) - \varepsilon(a - 1)\sigma(y - x_{1*} - ax_{2*}).$$

More precisely, we can construct a function $\beta \in \mathcal{KL}$ such that $|(\Sigma, \xi_1, \xi_2)(t)| \leq \beta(||(\Sigma, \xi_1, \xi_2)(0)||, t)$ for all $t \geq 0$ along all trajectories $(S, x_1, x_2)(t)$ of the closed loop dynamics.

**Simpler** than Mazenc-M-Harmand (ACC’07, TCAS’08), outputs, robust stability, explicit strict Lyapunov function.

Using a suitable bound $\tilde{\Delta}$ on $d = (d_1, d_2)$, we can design $\beta \in \mathcal{KL}$, $\alpha \in \mathcal{K}_\infty$ so that along the trajectories of

$$
\dot{S} = [D(y) + d_2](S_0 + d_1 - S) - \mu_1(S)x_1 - \mu_2(S)x_2
$$

$$
\dot{x}_i = [\mu_i(S) - D(y) - d_2]x_i, \quad i = 1, 2
$$

the errors satisfy an iISS [Sontag, 1998] estimate of the form

$$
\alpha(||(\Sigma, \xi_1, \xi_2)(t)||) \leq \beta(||(\Sigma, \xi_1, \xi_2)(0)||, t) + \int_0^t |d(r)|dr.
$$
Using a suitable bound $\bar{\Delta}$ on $d = (d_1, d_2)$, we can design $\beta \in \mathcal{KL}$, $\alpha \in \mathcal{K}_\infty$ so that along the trajectories of

$$
\dot{S} = [D(y) + d_2](S_0 + d_1 - S) - \mu_1(S)x_1 - \mu_2(S)x_2
$$

$$
\dot{x}_i = [\mu_i(S) - D(y) - d_2]x_i, \quad i = 1, 2
$$

the errors satisfy an iISS [Sontag, 1998] estimate of the form

$$
\alpha(||(\Sigma, \xi_1, \xi_2)(t)||) \leq \beta(||(\Sigma, \xi_1, \xi_2)(0)||, t) + \int_0^t |d(r)| \, dr.
$$

In the special case where $d_2 \equiv 0$, we get iISS if

$$
\bar{\Delta} = \frac{0.16\mu_1(S_*)S_*}{\mu_1(S_*) + \varepsilon|a - 1|}.
$$
Using a suitable bound $\bar{\Delta}$ on $d = (d_1, d_2)$, we can design $\beta \in \mathcal{KL}$, $\alpha \in \mathcal{K}_\infty$ so that along the trajectories of

$$\dot{S} = [D(y) + d_2](S_0 + d_1 - S) - \mu_1(S)x_1 - \mu_2(S)x_2$$
$$\dot{x}_i = [\mu_i(S) - D(y) - d_2]x_i, \quad i = 1, 2$$

the errors satisfy an iISS [Sontag, 1998] estimate of the form

$$\alpha(||(\Sigma, \xi_1, \xi_2)(t)||) \leq \beta(||(\Sigma, \xi_1, \xi_2)(0)||, t) + \int_0^t |d(r)|dr.$$ 

Further reducing $\bar{\Delta}$ gives usual ISS [Sontag, 1989] estimate

$$||(\Sigma, \xi_1, \xi_2)(t)|| \leq \beta(||(\Sigma, \xi_1, \xi_2)(0)||, t) + \gamma(||d||_\infty).$$

\[
\begin{align*}
\dot{S} &= (D(y) + d_2)(S_0 + d_1 - S) - \frac{0.05Sx_1}{20+S} - \frac{0.052Sx_2}{25+S} \\
\dot{x}_1 &= \left[\frac{0.05S}{20+S} - D(y) - d_2\right] x_1 \\
\dot{x}_2 &= \left[\frac{0.052S}{25+S} - D(y) - d_2\right] x_2
\end{align*}
\]

Choose \( y = x_1 + 0.8x_2 \), and \( x_{1*} = 0.05 \) and \( x_{2*} = 0.02 \).
\[ \begin{aligned}
\dot{S} &= (D(y) + d_2)(S_0 + d_1 - S) - \frac{0.05Sx_1}{20+S} - \frac{0.052Sx_2}{25+S} \\
\dot{x}_1 &= \left[\frac{0.05S}{20+S} - D(y) - d_2\right] x_1 \\
\dot{x}_2 &= \left[\frac{0.052S}{25+S} - D(y) - d_2\right] x_2
\end{aligned} \]

Choose \( y = x_1 + 0.8x_2 \), and \( x_{1*} = 0.05 \) and \( x_{2*} = 0.02 \).

- Our assumptions hold with \( S_* = 105 \), \( \varepsilon \in (0, 0.00753] \), \( S_0 = 105.07 \), and \( D(y) = 0.042 + 0.001506\sigma(y - 0.066) \).

Hence, all closed loop trajectories converge to \( (105, 0.05, 0.02) \) when \( d = 0 \).
\[
\begin{aligned}
\dot{S} &= (D(y) + d_2)(S_0 + d_1 - S) - \frac{0.05 S x_1}{20 + S} - \frac{0.052 S x_2}{25 + S} \\
\dot{x}_1 &= \left[ \frac{0.05 S}{20 + S} - D(y) - d_2 \right] x_1 \\
\dot{x}_2 &= \left[ \frac{0.052 S}{25 + S} - D(y) - d_2 \right] x_2
\end{aligned}
\]

Choose \( y = x_1 + 0.8 x_2 \), and \( x_{1*} = 0.05 \) and \( x_{2*} = 0.02 \).

- Our assumptions hold with \( S_* = 105, \varepsilon \in (0, 0.00753] \), \( S_0 = 105.07 \), and \( D(y) = 0.042 + 0.001506 \sigma(y - 0.066) \). Hence, all closed loop trajectories converge to \( (105, 0.05, 0.02) \) when \( d = 0 \).

- When \( d_1 \equiv 0 \), we get iISS to disturbances \( d_2(t) \) bounded by \( \Delta \approx 0.20 \mu_1(S_*) \) i.e. about 20% of \( D \).
\[
\begin{align*}
\dot{S} &= (D(y) + d_2)(S_0 + d_1 - S) - \frac{0.05Sx_1}{20+S} - \frac{0.052Sx_2}{25+S} \\
\dot{x}_1 &= \left[\frac{0.05S}{20+S} - D(y) - d_2\right] x_1 \\
\dot{x}_2 &= \left[\frac{0.052S}{25+S} - D(y) - d_2\right] x_2
\end{align*}
\]

Choose \( y = x_1 + 0.8x_2 \), and \( x_{1*} = 0.05 \) and \( x_{2*} = 0.02 \).

- Our assumptions hold with \( S_{*} = 105 \), \( \varepsilon \in (0, 0.00753] \), \( S_0 = 105.07 \), and \( D(y) = 0.042 + 0.001506\sigma(y - 0.066) \).
  Hence, all closed loop trajectories converge to \( (105, 0.05, 0.02) \) when \( d = 0 \).

- If instead \( d_2 \equiv 0 \), then we have iISS to disturbances \( d_1(t) \) bounded by \( \bar{\Delta} \approx 16 \), or about \( 15\% \) of \( S_0 = 105.07 \).
We used $d(t) \equiv (1, 0)$ and $(S, x_1, x_2)(0) = (103, 2, 1)$. 
We used \( d(t) \equiv (1, 0) \) and \( (S, x_1, x_2)(0) = (103, 2, 1) \).
We used \( d(t) \equiv (1, 0) \) and \( (S, x_1, x_2)(0) = (103, 2, 1) \).
We used $d(t) \equiv (1, 0)$ and $(S, x_1, x_2)(0) = (103, 2, 1)$.

**Persistence.** $(S(t), x_1(t), x_2(t)) \to (105, 0.05, 0.02)$, but with an overshoot determined by iISS and the magnitude of $d_1$. 
SUGGESTIONS

- It would be of interest to extend our work to **tracking** of prescribed oscillations. This would explain **oscillatory behaviors** observed in nature and suggest **feedback mechanisms** for achieving them.
SUGGESTIONS

- It would be of interest to extend our work to tracking of prescribed oscillations. This would explain oscillatory behaviors observed in nature and suggest feedback mechanisms for achieving them.

- Another desirable extension would be to models with three or more competing species, or more than one limiting substrate.
