

## Electromagnetic waves in a homogeneous medium

Let us consider traveling-wave solutions to the Maxwell equations in a homogeneous medium without sources:

$$\begin{aligned}\nabla \times \mathbf{E} &= -\frac{1}{c} \frac{\partial}{\partial t} \mu \mathbf{H}, & \nabla \cdot \epsilon \mathbf{E} &= 0 \\ \nabla \times \mathbf{H} &= \frac{1}{c} \frac{\partial}{\partial t} \epsilon \mathbf{E}, & \nabla \cdot \mu \mathbf{H} &= 0\end{aligned}$$

First, let  $\mathbf{E}$  and  $\mathbf{H}$  be harmonic in time:

$$\begin{aligned}\mathbf{E} &= \mathbf{E}(\vec{x}) e^{i\omega t}, \\ \mathbf{H} &= \mathbf{H}(\vec{x}) e^{i\omega t}.\end{aligned}$$

This form yields the harmonic Maxwell equations for  $\mathbf{E}(\vec{x})$ ,  $\mathbf{H}(\vec{x})$ :

$$\begin{aligned}\nabla \times \mathbf{E} &= -\frac{i\omega}{c} \mu \mathbf{H}, \\ \nabla \times \mathbf{H} &= \frac{i\omega}{c} \epsilon \mathbf{E}.\end{aligned}$$

Now let  $\mathbf{E}(\vec{x}) = \mathbf{E}_0 e^{i(k_1 x + k_2 y + k_3 z)}$ ,  $\mathbf{H}(\vec{x}) = \mathbf{H}_0 e^{i(k_1 x + k_2 y + k_3 z)}$ , so that  $\mathbf{E}$  and  $\mathbf{H}$  are travelling waves, as functions of time, in the direction of  $-\mathbf{k} = -(k_1, k_2, k_3)$ :

$$\begin{aligned}(\star) \quad \mathbf{E} &= \mathbf{E}_0 e^{i(k_1 x + k_2 y + k_3 z + \omega t)} \\ \mathbf{H} &= \mathbf{H}_0 e^{i(k_1 x + k_2 y + k_3 z + \omega t)},\end{aligned}$$

( $\mathbf{E}_0$  and  $\mathbf{H}_0$  are constant vectors.)

The harmonic Maxwell equations, with the given spatial form, yield

$$\begin{aligned} (*) \quad ik \times E_0 &= -\frac{i\omega}{c} \mu H_0 \\ ik \times H_0 &= \frac{i\omega}{c} \varepsilon E_0 \end{aligned}$$

Solving for  $E$ , we obtain

$$k \times (k \times E_0) = -\left(\frac{\omega}{c}\right)^2 \varepsilon E_0.$$

This tells us that  $E$  is perpendicular to  $k$ . More precisely,

$$k \times (k \times E_0) = -|k|^2 E_{0\perp} = -\left(\frac{\omega}{c}\right)^2 \varepsilon E_0,$$

where  $E_{0\perp}$  is the component of  $E_0$  orthogonal to  $k$ . The second equality says that  $E_0$  is a multiple of  $E_{0\perp}$ , so that  $E_{0\parallel} = 0$ , i.e.,  $E_0 = E_{0\perp}$ . Thus we obtain

$$|k| = \sqrt{\varepsilon \mu} \frac{\omega}{c}.$$

Now, the speed of propagation of the waves ( $v$ ) is equal to

$$v = \frac{\omega}{|k|} = \frac{c}{\sqrt{\varepsilon \mu}}.$$

If  $\varepsilon = 1$ ,  $\mu = 1$ , as in a vacuum, then  $v = c$ .

Similar analysis applies to  $H_0$ . In addition,  
(1) tells us that  $E$  and  $H$  are orthogonal to each other.  
Thus,  $E$ ,  $H$ , and  $k$  form an orthogonal system:
